Hot Sprue Bushings

Products / Technical Guide

SB24B HOT SPRUE BUSHINGS WITH BAND HEATER

Notes

1. Cold bushing length must allow for thermal expansion to fit specified mold length. Allow .003 x ("A") for thermal expansion of bushing.
2. All dimensions are in mm.
3. 420 SS bushings are also available for processing PVC or other corrosive materials.

Ideal for High Capacity Molding

Synventive SB24 hot sprue bushings are designed for highest capacity molding applications. These bushings are ideally suitable for all combinations of large shot and/or viscous materials. Two styles of SB24 bushings are available; band heated for bushings with an "A" length of < 380mm, and tubular heated for bushings with an "A" length of > 220mm. SB24 bushings with heater bands require only one heater band for operation. A spare heater band and thermocouple is installed for models with an "A" length > 215mm for protection against heater burnout or wire failure.

All bushings come complete with mineral insulated heater bands or high-reliability tubular heaters, thermocouples and support ring assembly. A .500, .750 or metric radius is provided per your specification.

Specifications

Max. Operating Pressure: 20,000 psi (1400 bar)

Max. Operating Temperature: 650°F (345°C)

Mode of Operation: Horizontal

Heater: 57mm I.D. x 63.5mm wide,
1,000 W, 120 or 240 V

Heater Clearance Diameter: 95 mm for
heater band

	mm

To Order:

- 1. Choose bushing based on mold depth ("A" dimension on drawing).
Each Synventive SB24 Hot Sprue Bushing is custom built to suit your exact mold depth. Specify the "A" dimension when ordering from 140mm min. - 380mm max.
- 2. Specify desired tip style (see p. 6 for tip descriptions) Synventive SB24 bushings are designed for highest flow capacity; therefore, CV-10 and CV-20 full flow tips are used exclusively.
- 3. Specify additional required information (based on tip style)
 - a. Please specify if material is glass filled. An abrasion-resistant insert will be supplied.
 - b. CV-10 tip has multiple insert orifice diameters. For optimum gate control, it is necessary to specify the required orifice diameter or specify the material, shot size and fill time for Synventive to determine what orifice diameter will best suit the application.
 - c. Specify 420 SS bushing if required.
 - d. See Technical Guide "Section E" for tip reduction/modification instructions.

Tip Style		Description		
CV-10		Gate/Full Flow		
CV-20		Open/Full Flow		

Tip Style ^a	Spherical Radius	Tip Extension	Tip Runner Radius	Tip Orifice
	.500 or .750 (12.7 or 19mm)		(0-4.7mm)

	SB24BT (top)
A = 331 – 380	SB24B38S (section)
	SB24BT (top)

"A" Dimension (Mold Depth)

When gating into a runner CV-20 tip styles are recommended. If using a CV-10 tip, tip should be "moved back" 1mm hot from parting line, so a thin wafer is molded.

Provide Synventive with exact dowel hole location on supporting ring for proper machining of runner radius.

To Order:

- 1. Choose bushing based on mold depth ("A" dimension on drawing).
Each Synventive SB24 Hot Sprue Bushing is custom built to suit your exact mold depth. Specify the "A" dimension when ordering from 220mm min. - 850mm max.
- 3. Specify additional required information (based on tip style)
 - a. Please specify if material is glass filled. An abrasion-resistant insert will be supplied.
 - b. CV-10 tip has multiple insert orifice diameters. For optimum gate control, it is necessary to specify the required orifice diameter or specify the material, shot size and fill time for Synventive to determine what orifice diameter will best suit the application.
 - c. Specify 420 SS bushing if required.
 - d. See Technical Guide "Section E" for tip reduction/modification instructions.

* Part area is total outside surface area not projected area (i.e. includes side walls, etc.).

- Material Factors:
 - Use Tabulated Orifice for PE, PP, PS, SAN, PUR
 - Use Tabulated Orifice x 1.15 for Acetal, PC, PPO, ABS
 - Use Tabulated Orifice x 1.30 for Acrylic, Nylon, PET, PBT (see note 5)
 - Use Tabulated Orifice x 1.50 for PVC
- This diameter is based on the flow and freeze characteristics of each type of plastic at its normal processing conditions. It is not dependent on the type of nozzle or whether it is fed by a hot or cold runner system.
 - Hot Runner Gates: CV-10, CV-11, CV-11S, CV-20, CV-21, CV-21S, EG-10
 - Cold Runner Gates: Pin, Sub-Gate, Edge-Gate

This diameter size applies to most gate styles.
- Some of the listed wall thickness and surface area combinations are not applicable to all plastics because of flow-length-to-wall ratios of each plastic – consult plastic supplier's processing recommendations (e.g. 400 inch² surface area of .060 (1.50 mm) wall is possible for some cavities with PE, but is not possible with most other plastics).
- The gate diameter limitations – minimum and maximum – which apply to each Synventive hot runner nozzle may require the actual gate to be slightly smaller or larger than the tabulated orifice.
- Due to the crystalline nature of Nylon, PET and PBT, the minimum orifice for non-reinforced grades should be .094 (2.39 mm) and for reinforced grades .156 (3.96 mm).
- For filled crystalline materials, nylon, PET and PBT when using full flow inserts, the gate orifice should be 1mm smaller than the insert orifice.

Notes

GR-Glass Reinforced

NR-Not Recommended for

Most Applications

Recommended Tip/Bushing

1. Most Suitable

2. Suitable with some

reservations:

e.g. Gate Control, etc.

(Not as good as category 1)

See page 24 for correct

Orifice Sizing

* USB5 & SB5 Bushings

are NR-For Glass

Filled Materials.

** SB24 Bushings are

available with CV-10 &

CV-20 tips only.

*** See Orifice Diameter

Requirements, page 24.

CONTROLLED VESTIGE (CV) TIPS

CV-10 Full-Flow

- This is the most widely used tip.
- Vestige height is equal to orifice diameter.
- Provides best gate control for most materials.
- Open flow bore provides low pressure drop.
- Tramp metal can usually flow through tip.
- Orifice is increased by simple straight reaming of diameter.

CV-11 Cone

- This tip style is used primarily to provide reduced vestige height, 0.4- 0.9mm high for all materials.
- Cone Point adds heat to center of orifice for nylon, acetal and PBT.
- Orifice adjustment requires added machining to hold land length at 0.08/0.13mm.

CV-20 Full-Flow

- Same as CV-10 except gate orifice is machined into mold plate to eliminate circular witness mark of tip.
- For use in gating into runner or directly onto part surface.

CV-21 Cone

- Same as CV-11 except gate orifice is machined into mold plate to eliminate circular witness mark of tip.
- For use in gating into runner or directly onto part surface.

TEMPERATURE CONTROLLERS

Single Zone 15 Amp Temperature Controller includes one thermocouple connector (80-M2MJ)			
Catalog Number	Amp/Voltage	Input connector Catalog No.*	Output connector Catalog No.*
80-PIM1A15	15A/240V	80-AC1524F (NEMA 6-15)	80-AC1524M (NEMA 6-15)
80-PIM1A151	15A/120V	80-AC1512F (NEMA 5-15)	80-AC1512M (NEMA 5-15)

Synventive offers a complete line of single and multi-zone temperature control systems. For details, see Temperature Control Systems Design Manual.

Tip Removal

1. Place a 36mm 6 point deep socket wrench over split wrench. Torque off tip with wrench assembly. See Figure 1.
2. Tips are usually removed at room temperature. If tip does not break free, heat bushing to operating melt temperature.

Insert Removal

1. The conductive BeCu insert should only be removed if it is to be replaced by a new insert. Reinstallation of the same insert may affect the heat transfer from the steel body to the BeCu insert.
2. Using an 11.1mm dia. drill, machine into the center of the insert for a depth of 15mm, and then thread using a M12 tap.
3. After the insert is tapped, thread in a M12 rod. Place the insert removal tool (Figure 3) over the rod. Using a M12 nut, thread the nut against the removal tool to pull out the insert. See Figure 2.

Tip Replacement

1. Clean any and all plastic from SYNVENTIVE-SEAL and from the inside sealing diameter on tip. Care must be taken not to damage SYNVENTIVE-SEAL.
2. Verify seating between tip and body by the application of blueing to tip seat.
3. Verify that the SYNVENTIVE-SEAL is in place prior to tip installation.
4. Torque tip to the recommended torque of 48 kg.M (350 ft.lb) for all tip styles (see tip removal for wrenching information).

Insert Replacement

1. Clean any and all plastic from the insert counter bore, measure the insert counter bore diameter and insert press diameter.
2. The diameter of the insert should be .013-.030mm larger than the diameter of the mating counter bore in the steel body. This is necessary to assure proper heat transfer to the BeCu insert.
3. The insert must be pressed so that the insert shoulder is flush with the tip seat $\pm .013$ mm (Figure 4). This is achieved by using the insert installation tool as shown in Figure 5. Use a small arbor press.

SYNVENTIVE-SEAL Replacement

Always inspect the SYNVENTIVE-SEAL when replacing a tip. No plastic should have leaked past the seal, nor should there be scratches or dents in the seal O.D. Thermal operation of the gate will be affected by any damage or plastic leakage.

Remove a damaged SYNVENTIVE-SEAL by using a removal tool to avoid scratching the insert sealing diameter. Replace the SYNVENTIVE-SEAL only onto an insert sealing diameter that is smooth and free of plastic. Use a light arbor press and pressing tool to bottom the SYNVENTIVE-SEAL on the insert shoulder. Do not overpress.

BARNES™
MOLDING SOLUTIONS

Barnes Molding Solutions is the expert cluster for molds, hot runners, and controls for industrial plastic injection molding. Our brands Foboha, Männer, Synventive, Thermoplay, Priamus and Gammaflux are leaders in their field. We have a comprehensive and in-depth understanding of the automotive, medical, packaging and electronics industries. We support our customers with sophisticated high-performance technologies through to customized turnkey solutions.
